

# Emby Server

Emby (formerly Media Browser) is a media server designed to organize, play, and stream audio and video to a variety of devices.

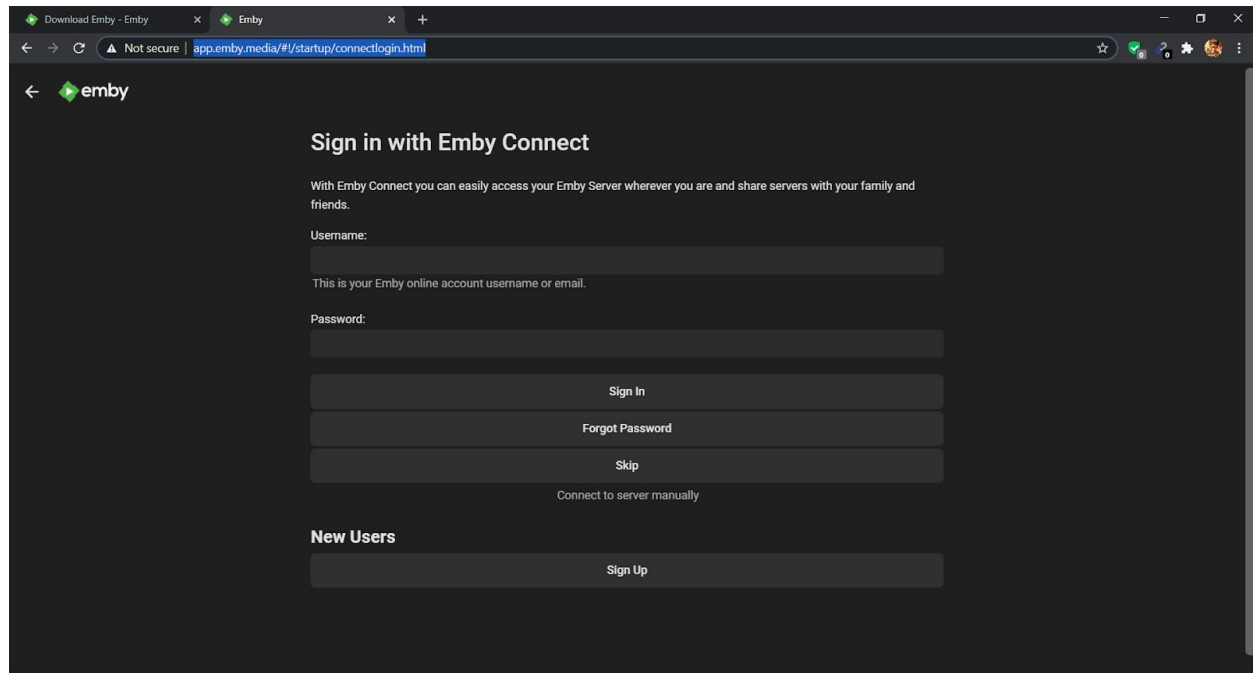

## Tutorial to setup and use emby

1. Create and host a server by downloading the emby software as per your system requirement from <https://emby.media/download.html>

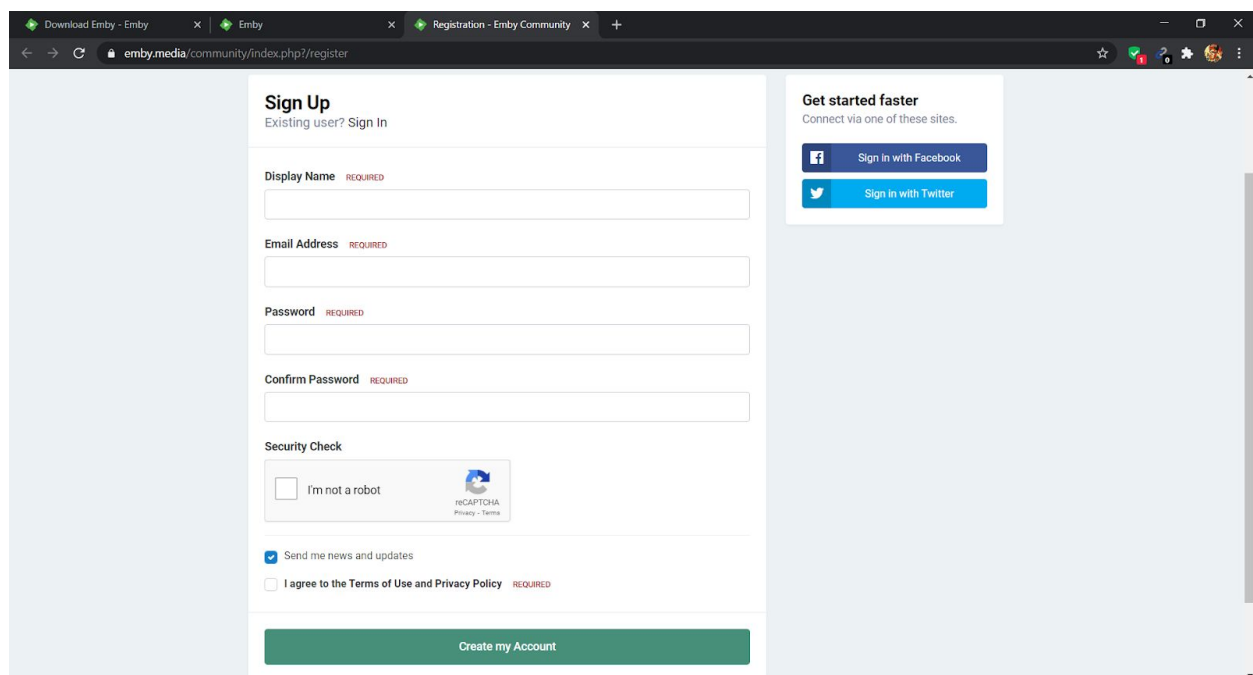

Note : You can only upload the files from the system where you have hosted your emby server.

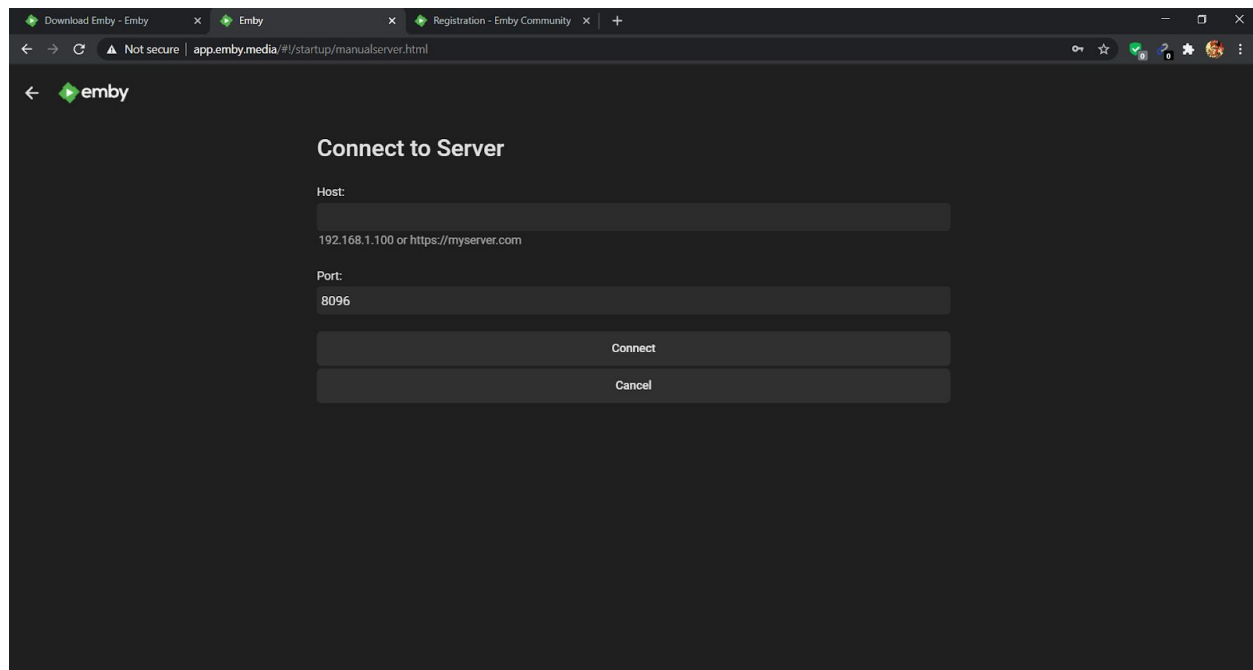

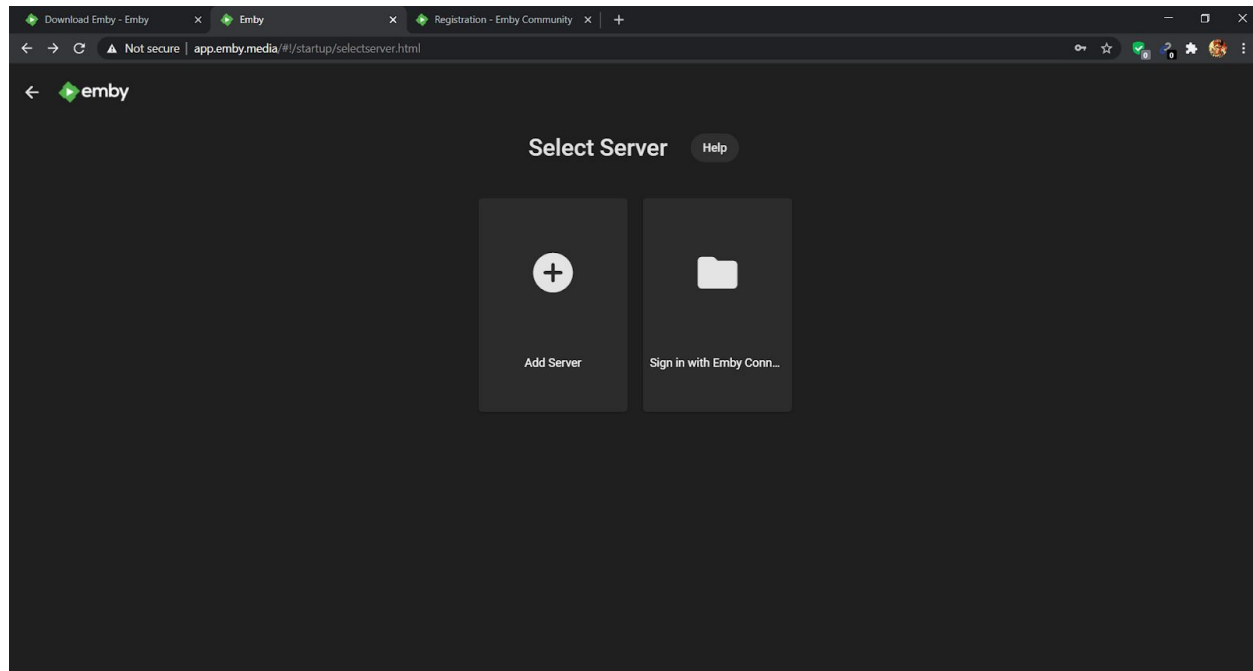

2. After hosting the server you need to connect to the server.
  - a. Go to the sign page <http://app.emby.media/#!/startup/connectlogin.html>
  - b. Provide your username and password.

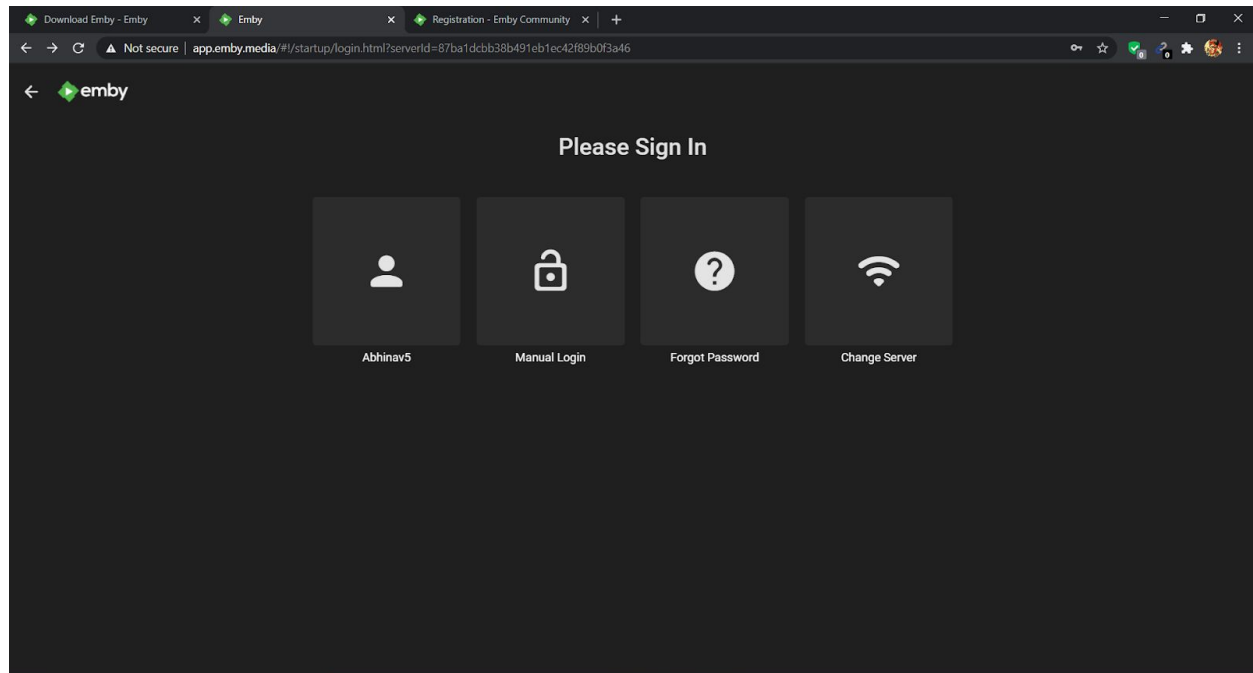

- c. If you don't have an account on emby create one by clicking on the sign up button.

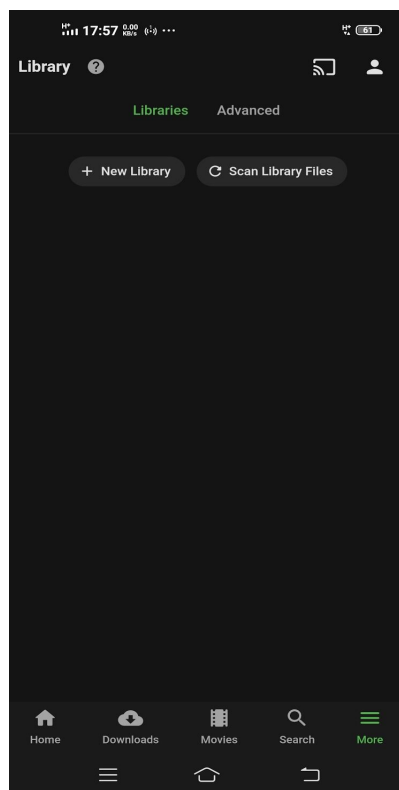

3. After signing in you need to connect to the server you hosted. Click on the Add server button and provide the server address in the host field.

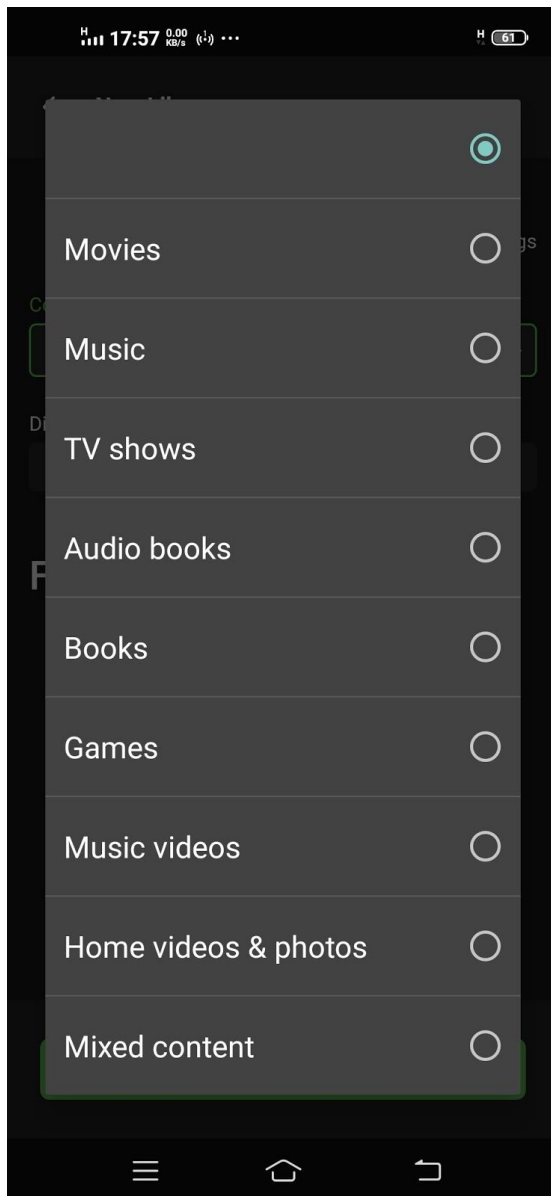

4. After connecting to the server you need to sign in again with the account you created and you are done.

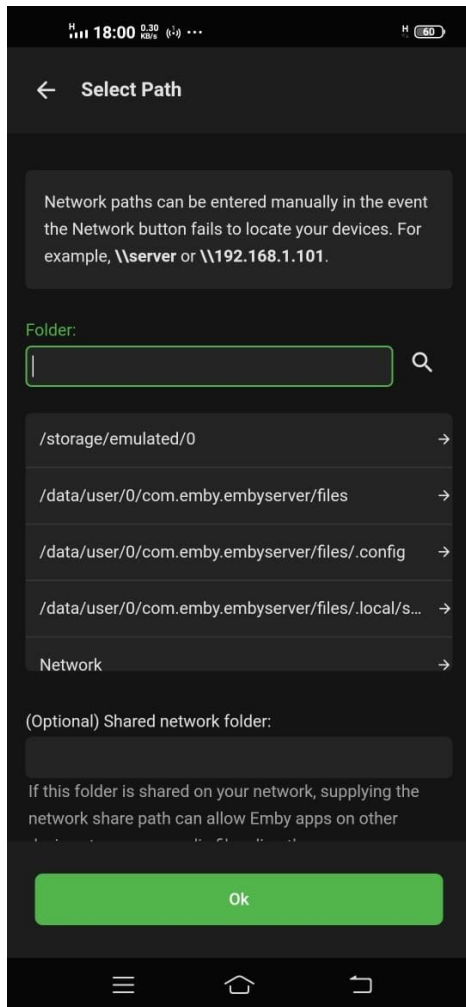

5. Your setup is now done. Now you can upload your files on your Emby server.
  - a. For uploading your media files click on the hamburger menu and click on Library. You'll get a page like this.

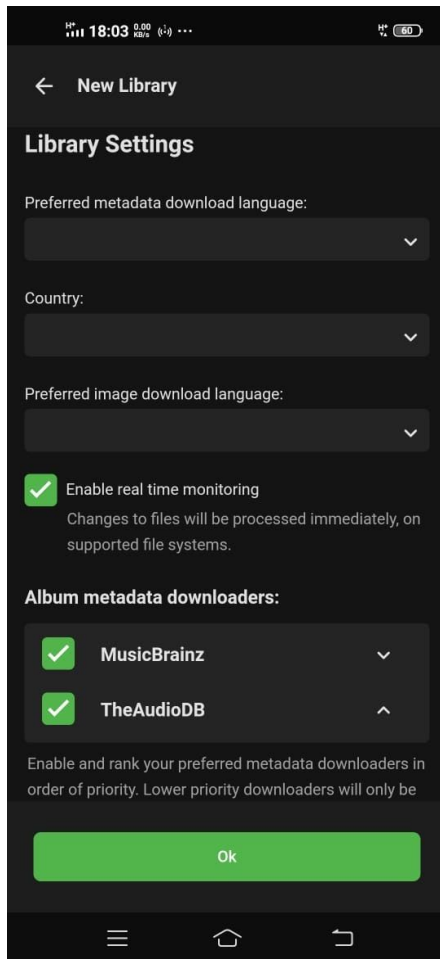

- b. Click on the new library to create your new folder. You can choose the content type as per the files you are uploading and give a display name which will be displayed on the home page.

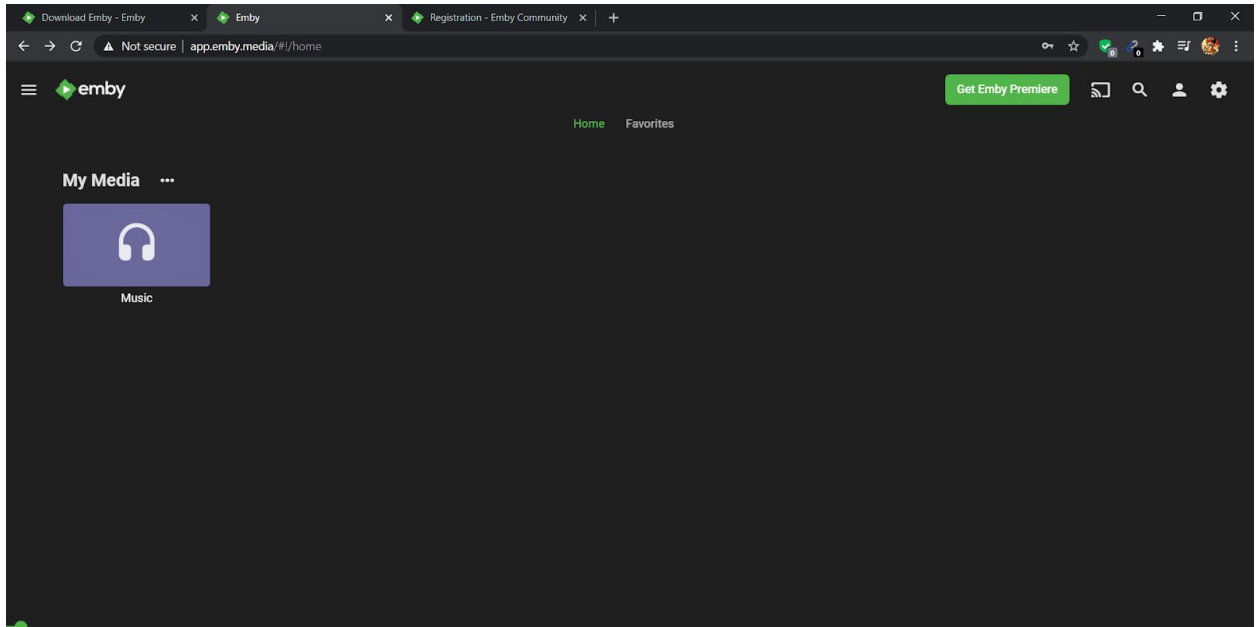

- c. Say you want to upload your music files. Click on the + button besides folder and add the file path to your folder.

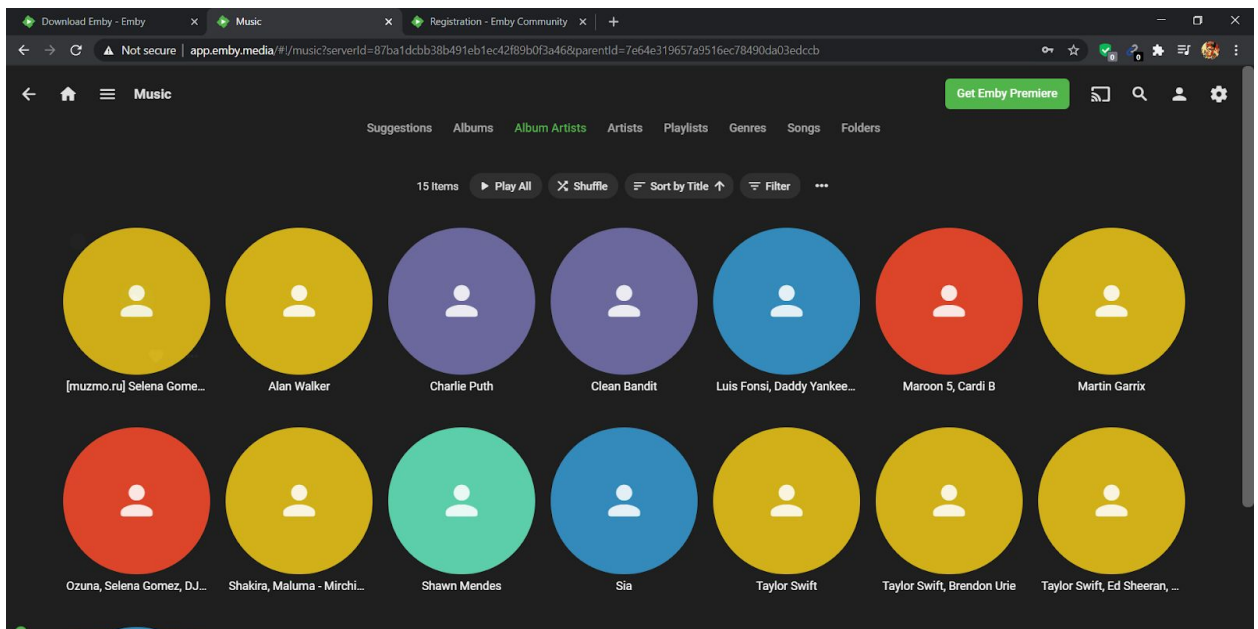

- d. Scroll down and give your library settings like Preferred metadata language, Country, etc and then click ok. You have now created a folder.

6. Click on the home button in the hamburger menu and you will find your uploaded folder there.

7. Emby will categorize the music files according to the artists, genres, albums(For Music). Now you can select your favourite music you want to listen to.

8. You can also create different users .
